
A16 regional simulations retain quasi-ballistic peak migration under the unified M1-M6 model ladder
M1: Flat / no heterogeneity
M2: Topography / no heterogeneity
M3: Flat / heterogeneity
M4: Topography / heterogeneity
M5: Flat / heterogeneity / low-V
M6: Topography / heterogeneity / low-V
Linear: a + bR
Squared distance: a + cR²
(a) Ray 1
(b) Ray 2
(c) Ray 3
20 s-smoothed energy-peak time, t_{peak} (s)
Source-receiver distance, R (km)
(d) Model-selection evidence; positive values favor linear peak migration
ΔAIC = AIC(R²) − AIC(linear)
Ray 1
Ray 2
Ray 3
ΔAIC = 10
18/18 ray-model tests favor linear; minimum ΔAIC = 56.3.
M5-M6 fits use censor-safe samples.
